                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes the novel use of interferons (IFNs) or DNas capable of expressing the interferons and/or antigenic proteins (AP), antigenic peptides derived from the proteins or DNas capable of expressing the antigenic proteins or peptides, in the manufacture of an agent for induction of antigen-specific T cells. The products of the Invention have virucide and cytostatic activity and can be used for gene therapy or as inducers of antigen-specific T cells. The action of interferon-alpha (IEN-alpha) in a system for inducing specific cytotoxic r cell (CTL) by administering an antigenic peptide in an incomplete Freund's adjuvant (IFN) emission preparation form was evaluated. IFNs (DNA encoding IFNs) are useful in the manufacture of a medicament for inducing antigen-specific T cells in an individual who has been administered with AP (or DNA encoding AP) or vice versa. The medicament is useful for the treatment or prophylaxis of a tumor or a viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Use of antigenic proteins, peptides, interferon or their encoding DNA, in the manufacture of an agent for the induction of antigen-specific {\bf T}
             This sequence represents a cyclophilin B peptide of the invention. The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours.
                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                         Tumor antigenic peptide: interferon; IFN; antigen-specific T cell; virucide; cytostatic; gene therapy; IFN-alpha; cytotoxic T cell; viral infectious disease; cyclophilin B; human.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    expressed sequence tag; secreted protein; cDNA isolation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is a polypeptide encoded by one of a large number of 5 ESTS derived from mRNAs encoding secreted proteins. The 5 ESTS were prepared from total human RNAs or poly4+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3 untranslated region (UTR) of the mRNA because they are often obtained from oligo-dry primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTS are derived from mRNAs with intact 5' of the and send sand can therefore be used to obtain full length cDNAs and genomic buns. 5' ESTS are also used in diagnostic, forensic, gene therapy and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAF15566 to AAF16505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used for detection of prostate cancer, chromosome polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and prolliferative disorders, wounds, and infectious diseases. AAR16506 to AAR16514 to AAB57303 represent sequences used in the exemplification of the present

Novel composition for modulating somatolactogenic function, comprises cyclophilin B, its mutant or an inhibitor of interaction of cyclophilin B with somatolactogenic hormone

Disclosure; Page -; 21pp; English.

```
The invention relates to a composition for modulating somatolactogenic function, comprising cyclophilin B (CypB), a mutant of cyclophilin B (pyB), a mutant of cyclophilin B (PyB), a mutant of cyclophilin B (PyB), a mutant of cyclophilin B contains a comparable of cyclophilin B with a somatolactogenic character to a method of identifying inhibitors of somatolactogenic also relates to a method of identifying inhibitors of somatolactogenic functions using CypB and a somatolactogenic hormone, and a method for diagnosing diseases associated with abnormal somatolactogenic functions by assessing CypB and a sample from a patient. Cyclophilin B is useful for augmenting somatolactogenic hormone, is useful for augmenting somatolactogenic function in the animal, and cyclophilin B mutant or a composition comprising cyclophilin B is useful in the treatment of immunosuppression, of the treatment of short stature, muscle wasting and osteoporosis. A composition comprising cyclophilin B mutant or a composition comprising cyclophilin and because and processes.

C hormone, is useful for treating HIV infection, breast and processes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cancer, gigantism/acromegaly, and hyperprolactinaemia. The present sequence represents a human cyclophilin B C-terminal mutant, CypB-AIAKE. Note: The present sequence is not shown in the specification, but is derived from the wild-type CypB sequence shown on pages 17-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

C G. This color was isolated from a substracted sub-library contg.

G Genes induced by treatment of the stromal cell line with interleukin.

I (IL-1). The message levels for cyp C show a 2-3 fold induction by creatment with IL-1, and this color exhow a 2-3 fold induction by with known cyclophilins. Cyp C is distinct from mammalian cyclophilins. Cyp C is distinct from mammalian cyclophilins A and B in both sequence and tissue distribution of cyclophilins A and B in both sequence and tissue distribution of cyclophilins are some section of the mammalian completely inhibited by addition of cyclosporin A (CsA). These cyp C is usion proteins and be used as ligands for the ladentification of intracellular proteins which together form high affinity associations. For example, the cyp C fusion protein binds to a protein of 77 kD in the absence of CsA, while in the presence of CsA it no longer binds to this p77, but instead binds specifically to a protein of 55 kD, identified as calcineurin (U.S.S.N.07/740175).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

```
This sequence shows Aspergillus niger cyclophilin-like peptidyl prolyl cis-trans isomerase (CYPB). CYPB is capable of catalyzing the cis-trans isomerase (CYPB). CYPB is capable of catalyzing the cis-trans isometization of a peptide bond on the N-terminal side of proline residues in polypeptides. CYPB are useful in methods for increasing the yield of secreted polypeptides from cells. The secreted polypeptides may be enzymes (such as chymosin, thaumatin or alpha-galactosidase) that can be used in food processing, a pest toxin, adenosine diphosphate (ADP)-glucose pyrophosphorylase, a glucanase or beta-1,4-endoglucanase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human cyclophillin B; CypB; prolactin-binding; growth hormone-binding; sometolactogenic function modulator; immunosuppression; short stature; muscle wasting; ostcoporosis; HIV infection; breast cancer; prostate cancer; glgantism; acromegaly; hyperprolactinaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8-JUN-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8-JUN-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8-JUN-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3-JUN-
  The invention relates to a composition for modulating somatolactogenic function, comprising cyclophilin B (CypB), a mutant of cyclophilin B (particularly a CypB mutant in which residues 2-12 of the mature protein care absent) or an inhibitor of the interaction of cyclophilin B with a somatolactogenic hormone (e.g., prolactin, growth hormone). The invention also relates to a method of identifying inhibitors of somatolactogenic functions using CypB and a somatolactogenic hormone, and a method for diagnosing diseases associated with abnormal somatolactogenic functions by assessing CypB levels in a sample from a patient. Cyclophilin B is useful for augmenting somatolactogenic function in the animal, and cyclophilin B mutant or a composition comprising an inhibitor of the interaction of cyclophilin B with a somatolactogenic function in the animal. A composition comprising cyclophilin B is useful in the treatment of immunosuppression, in the treatment of short stature, muscle wasting and osteoporosis. A composition comprising cyclophilin B mutant or a composition comprising cyclophilin B mutant or a composition comprising cyclophilin B with a somatolactogenic composition comprising cyclophilin B with a somatolactogenic connone, is useful for treatment of interaction of cyclophilin B with a somatolactogenic connone, its useful for treating HIV infection, breast and prostate cancer, gigantism/acromegaly, and hyperprolactinaemia. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                   Novel composition for modulating somatolactogenic function, comprises cyclophilin B, its mutant or an inhibitor of interaction of cyclophilin B with somatolactogenic hormone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB4239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities controlled: Cytostatic; proliferative; vulnerary: Immunomodulator; antidiabetic; antiathmatic; antithermatic; an

inflammation, cancers, cardiovascular disorders, neurological disease and bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in drug screens. AAC78449 to AAC78457 and AAB4240 represent sequences used in the exemplification of the present invention.

The enzyme is useful for accelerating protein folding, especially for activating recombinantly produced proteins. The PPIase can be produced in the same cell as the recombinant proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptidyl-prolyl cis-trans isomerase(s) from yeast and E.coli - used to accelerate protein folding

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                        January 15, 2002, 13:00:24; Search time 37.64 Seconds

Peptidylprolyl isomerase (EC 5.2.1.8) ROC4 - Arabidopsis thallane
Nylternate names: cyclophill, homolog ROC4; protein F21F14.200
C;Species: Arabidopsis thallana (mouse-ear cress)
C;Date: 19-May-1995 #sequence_revision 19-Nay-1995 #text_change 19-May-2000
C;Accession: B53422; T47995
J. Biol. Chem. 269, 7863-7868, 1994
A;Ttle: Cloning and characterization of chloroplast and cytosolic forms of cyclophil A;Reference number: A53422; MUID:94179146
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A;Molecule type: mRNA

SwissProt\_39:\* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A chen H., Li X.-L., Ljungdah L.G.;

A cyclophilin from the polycentric anaerobic rumen fungus Orpinomyces

T. A cyclophilin from the polycentric anaerobic rumen fungus Orpinomyces

T. Strain PC-2 is highly homologous to vertebrate cyclophilin B.";

Proc. Natl. Acad. Sci. U.S. A. 92.2587-2591(1995).

C. -! FUNCTION: PPLASES ACCELERATE THE FOLDING OF PROTEINS.

C. -! FUNCTION: PPLASES ACCELERATE THE FOLDING OF PROTEINS.

C. -! ENZYER ERCULATION: CYCLOSPORIN A (CSA) INHIBITS CYPB.

C. -! SUBCELLULAR LOCATION: ENDOPLASMIC RETICULUM LUMEN (BY SIMILARITY).

C. -! SIMILARITY: BELONGS TO THE CYCLOPHILIN-TYPE PPLASE FAMILY.

                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes the novel use of interferons (IFNs) or DNAs capable of expressing the interferons and/or antiquency proteins (AP), antiquency peptides derived from the proteins or DNAs capable of expressing the antiquency or peptides, in the manufacture of an agent for induction of antiquen-specific T cells. The products of the invention have virucide and cytostatic activity and can be used for gene therapy or as inducers of antiquen-specific T cells. The action of interferon-alpha (IFN-alpha) in a system for inducing specific cytotoxic T cell (CTL) by administering an antiqueinc peptide in an incomplete Freund's adjuvant (IFA) emulsion preparation form was evaluated. IFNs (or DNA encoding IFNs) are useful in the manufacture of a medicament for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               inducing antigen-specific T cells in an individual who has been administered with {\sf AP} (or DNA encoding AP) or vice versa. The medicament is useful for the treatment or prophylaxis of a tumor or a viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Use of antigenic proteins, peptides, interferon or their encoding DNA, in the manufacture of an agent for the induction of antigen-specific {\tt T} cells -
           This sequence represents a cyclophilin B peptide of the invention. The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours.
                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oilgo-dry primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rately included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full.length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

```
The invention relates to a composition for modulating somatolactogenic function. Comprising cyclophilin B (CypB), a mutant of cyclophilin B (particularly a CypB mutant in which residues 2-12 of the mature protein are absent) or an inhibitor of the interaction of cyclophilin B with a somatolactogenic hormone (e.g., prolactin, growth hormone). The invention also relates to a method of identifying inhibitors of somatolactogenic functions using CypB and a somatolactogenic hormone, and a method for diagnosing diseases associated with abnormal somatolactogenic functions by assessing CypB levels in a sample from a patient. Cyclophilin B is useful for augmenting somatolactogenic function in the animal, and cyclophilin B mutant or a composition comprising an inhibitor of the interaction of cyclophilin B with a somatolactogenic hormone, is useful for inhibiting somatolactogenic function in the animal. A composition comprising cyclophilin B is useful in the treatment of immunosuppression, in the treatment of short stature, muscle wasting and osteoporosis. A composition comprising cyclophilin B mutant or a composition comprising an inhibitor of the interaction of cyclophilin B with a somatolactogenic composition comprising HVV infection, breast and prostate and prosecute.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cancer, gigantism/acromegaly, and hyperprolactinaemia. The present sequence represents a human cyclophilin B C-terminal muttant, CypB-AIAKE. Note: The present sequence is not shown in the specification, but is derived from the wild-type CypB sequence shown on pages 17-18.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

The invention relates to a composition for modulating somatolactogenic function, comprising cyclophilin B (CypB), a mutant of cyclophilin B (particularly a CypB mutant in which residues 2-12 of the mature protein are absent) or an inhibitor of the interaction of cyclophilin B with a somatolactogenic relates to a method of identifying inhibitors of somatolactogenic also relates to a method of identifying inhibitors of somatolactogenic functions using CypB and a somatolactogenic hormone, and a method for diagnosing diseases associated with abnormal somatolactogenic functions using CypB levels in a sample from a patient. Cyclophilin B is useful for augmenting somatolactogenic hormone, is useful for augmenting somatolactogenic function in the animal, and sucception of cyclophilin B with a somatolactogenic function in the animal. A composition comprising cyclophilin B with a somatolactogenic function in the animal. A composition comprising cyclophilin B with a somatolactogenic function in the treatment of immunosuppression, in the treatment of short stature, muscle wasting and osteoporosis. A composition comprising cyclophilin B mutant or a composition comprising cyclophilin B mutant or a composition comprising cyclophilin B with a somatolactogenic function, breast and prostate cancer, glgantism/acromegaly, and hyperprolactinaemia. The present cancer, glgantism/acromegaly, and hyperprolactinaemia. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel composition for modulating somatolactogenic function, comprises cyclophilin B, its mutant or an inhibitor of interaction of cyclophilin B with somatolactogenic hormone -

Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a polypeptide encoded by one of a large number of 5 ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for itsolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are derived from mRNAs with intex 5' ends and can therefore be used to obtain full length cDNAs and genomic CNROMS. 5' ESTs are also used in diagnostic, forensic, gene therapy and refunces mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Dumas Milne Edwards J, Duclert A, Glordano J;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB4239. The proteins can have activities based on the tissues and cells the genes are expressed in Example of activities cinclude: cytostatic; proliferative; vulnerary; immunomodulator; antidabetic; antisthematic; antibaterial; antitificamatory; antithyrian antitificamatory; antithyrian antitificamatory; antithyrian; antitificamatory; antithyrian; cardiant; thrombolytic; coaquiant; nootropic; vasotropic; antipsoriatic and antiangiogenic. The polynucleotides and polypeptides cand antiangiogenic. The polynucleotides and polypeptides and diagnosing pathological conditions. Polynucleotides and polypeptides and diagnosing pathological conditions. Polynucleotides, polypeptides, antibodies, agenthological conditions in the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoletic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection, modulate haemostatic or thrombolytic activity, and disease and bacterial or viral infections. The peptides, nucleotides, antibodies, agonists and AAB44240 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                       diagnosis: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antiviral; antidiabetic; antiasthmatic; antirheumatic; antibaterial; cardiant; dermatological; neuroprotective; thrombolytic; coagulant; nootropic; vasotropic; antipactive; thrombolytic; coagulant; nootropic; immune disorder; heematopoietic cell disorder; antidiamation; immune disorder; heematopoietic cell disorder; autoimmune disorder; haematopoietic cell disorder; autoimmune disorder; neaction; saft versus host disease; organ rejection; neurological disease; drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel isolated nucleic acids comprising sequences encoding peptides useful for treating or diagnosing e.g. cancer

ANUIZI72-AAUIZ446 represent novel human secretory and transmembrane PRO polypeptides. The PRO polypeptides are useful to detect other PRO polypeptides. To link bloactive molecules to cells expressing PRO polypeptides, to anount because to cells expressing pro properties to modulate blological activities of cells expressing CRO polypeptides, and to detect the presence of mammalian lung, collon, cheast, prostate, rectal, cervical or liver tumours by comparing PRO, polypeptide expression in a cell sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor-labha (TNR-alpha) from human blood, the proliferation or differentiation of chondrocytes, the proliferation of human of any period of a cytokine from periopheral blood carillage, the proliferation of inner ear unitcular supporting cells or of T-lymphocytes, the release of a cytokine from peripheral blood the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide collecules involved in binding interactions. The polynucleotides encoding
cartilage; ear; proliferation; glucose; free fatty acid; skeletal muscle; adipocyte; A-peptide; factor VIIA; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Isolated, secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bioactive molecules to cells expressing PRO polypeptides, and detect the presence of mammalian tumours e.g. lung, breast, prostate, cervical

The colon cancer antigans are collectively known as colon cancer antigans. The colon therepy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and per can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AMH31196 to AMH37204

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a cyclophilin B peptide of the invention. The peptides are tumour antigen peptides derived from cyclophilin B, that recognise cytotoxic T-cells (CTL) which bind to the HLA antigen. The peptides are used for the treatment and diagnosis of tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

This invention describes the novel use of interferons (IFNs) or DNAs capable of expressing the interferons and/or antigenic proteins (AP), antigenic opeptides derived from the proteins or DNAs capable of expressing the antigenic proteins or paptides, in the manufacture of an agent for induction of antigen-specific T cells. The products of the invention have virucide and cytostatic activity and can be used for gene therapy or as inducers of antigen-specific T cells. The action of interferon-alpha (IFN-alpha) in a system for inducing specific cytotoxic T cell (CTL) by administering an antigenic peptide in an incomplete Freund's adjuvant (IFA) emulsion preparation form was evaluated. IFNs (or DNA encoding IFNs) are useful in the manufacture of a medicament for inducing antigen-specific T cells in an individual who has been administered with AP (or DNA encoding AP) or vice versa. The medicament is insertius disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular; vulnerary; gastrointestinal; nephrotropic; antiinfective; gynaecological; antibacterial; gene therapy; neural; immune; reproductive; renal; gastrointestinal; pulmonary; cardiovascular; proliferative disorder; wound; infectious disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; prostate cancer; prostate cancer antigen; detection; dlagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Use of antigenic proteins, peptides, interferon or their encoding DNA, in the manufacture of an agent for the induction of antigen-specific {\bf T}

A third mammalian cyclophilin, cyp C, was isolated from a CDNA library prepd. from the murine bone marrow derived stromal cell line AC 6. This cDNA was isolated from a substracted sub-library contg. Genes induced by treatment of the stromal cell line with interleukingers of (IL-1). The message levels for cyp C show a 2-3 fold induction by treatment with IL-1, and this cDNA exhibits a high level of homology with known cyclophilins. Cyp C is distinct from mammalian cyclophilins. Cyp C is distinct from mammalian cyclophilins A and B in both sequence and tissue distribution of expression. A fusion protein conque, e.g. amino acids i6-212 of cyp C possesses peptidyl-probyl isomerase (PPlase) activity which can be completely inhibited by addition of cyclosporin A (CsA). These cyp C fusion proteins can be used as ligands for the identification of intracellular proteins which together form high affinity associations. For example, the cyp C fusion protein binds to a protein of 77 kD in the absence of CsA, while in the presence fo CsA it no longer binds to this p77, but instead binds specifically to a protein of 55 kD, identified as calcineurin (U.S.S.N.07/740175).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cyclophilin-like peptidyl prolyl cis-trans isomerase; CYPB; food processing; Endoplasmic retention signal; cis-trans isomerization; protein secretion; toxin; ADP-glucose pyrophosphorylase; glucanase; beta-1,4-endoglucanase.
                                                                                                                         Cyclophilin C polypeptide and nucleic acid encoding it - useful for screening a tissue-specific immunosuppressive agent
